

NMC

Nozzle Mix Gas/Oil Combination Burners

NMC-1
Edition 10-08

Hauck, a product brand
of the Elster Group

- Burns most gaseous fuels and No. 2 oil
- Sealed-in capability
- Stable flame over entire operating range
- Preheated air to 800°F (425°C)
- Gas pilot ignition
- Wide turndown
- Low maintenance

Hauck's NMC nozzle mix gas/oil combination burners are designed for applications requiring a general purpose, long life, low maintenance burner.

Operation. Combustion air and fuel are channeled into the burner nozzle separately, permitting wide turndown. Since the burner nozzle is sealed into the refractory tile, all combustion air is supplied through the burner. The NM series burners couple a uniform flame front with flame stability over the entire operating range.

NM burners are available for preheated air operation up to 800°F (425°C) for high temperature furnace applications. Atomizing air is maintained at ambient conditions during preheated air operation.

The burners can be controlled manually or automatically. Automatic control normally employs a ratio regulator for each control zone or burner to maintain air-fuel ratio. An alternate system uses control valves in each of the fuel and air lines, linking the valves to a single motor controller.

Use of the NM in recuperative systems results in an economical approach to energy savings.

Gas Pilot Ignited NMC Burner

Construction. With no moving parts, the burner is virtually maintenance free. Parts subject to heat are constructed of either heat resistant cast iron or stainless steel. Special refractory materials and jacketed tiles can be supplied upon request.

Mounting. The burner, mounting plate and refractory tile are shipped as an assembled unit. The burner can be mounted to fire in horizontal or vertical down position. The air connection can be rotated to any of three other positions.

Each NM burner is equipped with companion flanges on the main air connections to permit easy burner installation and removal and allow the mounting of an orifice plate for reduced air flows, if required.

Ignition. The burner mounting plate includes a port for the gas pilot ignition system. The pilot is required for initial burner ignition only and is not required to maintain ignition.

Flame Supervision. The NM mounting plate is provided with a port for monitoring the pilot and main flame using a UV scanner or other suitable device.

Table 2.

NOTES FOR TABLES 1 AND 2:

- Fuel Capacity based on 138,000 BTU/gal oil and 20% excess air. Natural gas 1040 BTU/Cu Ft. with 10% excess air.
- Air pressure is "total pressure" measured 6 pipe diameters from burner.
- Oil Pressure should be at least 5-10 psig at the burner and 30-50 psig upstream of the oil ratio regulator.

- Natural gas pressure required at the burner is 6" w.c. for capacities listed at 16 oz. air pressure.
- When firing on gas only, the primary air must be used along with the secondary air and must be set at 4" w.c. minimum.
- When firing on oil only, the primary air must be set as specified in Table 2.

GAS - MAXIMUM % EXCESS AIR

CAPACITY TABLE AND APPLICATION NOTES

- Fuel capacity based on light oil at 138,000 Btu/gal and natural gas at 1040 Btu/cu ft.
- Natural gas flows shown for 10% excess air, 6"wc inlet pressure. Oil flow capacities computed for 20% excess air.
- Primary air scfm shown at 16 osig pressure for oil atomization on all model. Set primary air at 1 osig when firing models H210 through H260 on gas.
- Primary air flow stated at ambient temperature at 16 osig. Do not heat primary air.
- Combustion air capacities at 16 osi total pressure. Air flows at lower pressures proportional to $\sqrt{P/16}$. Air flows at intermediate temperatures proportional to $\sqrt{\frac{860}{T_h+460}}$ times the flow at 400°F.
- Include sensible heat of preheated air when computing total burner heat output. Sensible heat Btu/hr = scfm x 1.11 x $\Delta T(^{\circ}\text{F})$.
- Maximum % excess air limits (approximate) shown for 16 osig secondary air pressure.
- Turndown on gas approx. 8:1 at 400°F, 7:1 at 800°F; turndown on oil approx. 4:1.
- To size pipe for preheated air, compute acfm = scfm $(\frac{T+460}{520})$.
- When supervising flame, provide approximately 16 osig ambient purge air (1-1/2 – 2 cfm) to standard scanner purge assembly.
- Flame lengths are shown in Hauck Application Sheet GJ58.
- When sizing blower, consider application and operation so as to prevent overloading the blower motor at ambient scfm.

ALL MODELS:

See burner selection data, Hauck sheet NMC-4, Supplemental Data

NM NOZZLE MIX BURNERS FLAME LENGTHS

This sheet provides approximate flame length and diameter for Hauck NM Nozzle Mix Burners. These guidelines are furnished to aid in the proper selection of a NM burner for a specific furnace application.

Flame length will vary depending upon actual operating conditions. A *shorter* flame can be expected with higher temperature furnace and a faster burning gas. A *longer* flame can be expected with less excess air in the furnace, slower burning gas, and very high draft (parallel flow).

<u>Size</u>	<u>Fuel</u>	<u>Capacity Btu/hr</u>	<u>Flame Length</u>	<u>Flame Diameter</u>
NM210	Oil	371,000	1.5 Ft	6"
NM210	Gas	365,000	1.5 Ft	6"
NM215	Oil	722,000	3.0 Ft	7"
NM215	Gas	764,000	3.0 Ft	6"
NM220	Oil	1,458,000	3.5 Ft	10"
NM220	Gas	1,435,000	3.5 Ft	9"
NM230	Oil	3,005,000	5.0 Ft	12"
NM230	Gas	2,968,000	4.5 Ft	12"
NM240	Oil	4,505,000	6.5 Ft	15"
NM240	Gas	4,500,000	5.5 Ft	14"
NMC260	Oil	8,540,000	9.5 Ft	21"
NMC260	Gas	8,510,000	7.5 Ft	18"
NMG260	Gas	8,510,000	9.0 Ft	26"

NOTE

Combustion air capacities at 16 osi total pressure

Gas capacity based on 10% excess air

Oil capacity based on 20% excess air

Flame lengths measured at stoichiometric burner operation

Flame length (estimate) at 24 osig; add 20%

Flame length (estimate) at 8 osig; subtract 15%

Flame lengths were measured in Hauck's laboratory furnace using natural gas, No. 2 oil and room air in a cold (ambient temperature) furnace and medium draft conditions (0-.2" wc). Excess air was available in the furnace although burner ratio conditions were as stated above.

SUPPLEMENTAL DATA

NMC NOZZLE MIX BURNERS COMBINATION FUEL FIRED

TYPICAL MULTIPLE BURNER SYSTEM RATIO CONTROL

NOTES:

1. OIL RATIO REGULATOR OUTLET CAN NOT BE LOCATED MORE THAN 6" (152MM) LOWER AND NEVER HIGHER THAN THE CENTER LINE OF THE BURNER OIL VALVE FOR HORIZONTALLY MOUNTED BURNERS. OIL RATIO REGULATOR MUST BE MOUNTED WITHIN 20' (6M) OF LESS OF THE OIL BURNERS. IF BURNERS IN THE ZONE ARE MOUNTED AT DIFFERENT ELEVATIONS, ADDITIONAL OIL RATIO REGULATORS ARE REQUIRED (CONSULT HAUCK).
2. OPTIONAL GAS MANIFOLDS CAN BE UTILIZED FOR MULTIPLE BURNERS FIRING INTO A COMMON HEATING CHAMBER, HOWEVER, SPECIAL FEATURES ARE REQUIRED IN THE ASSOCIATED CONTROL SYSTEM (SEE HAUCK APPLICATION SHEET GJ76).
